

Week 5 Project - Power BI Data Model Relationships

The screenshot displays the Microsoft Power BI Desktop interface, focusing on the data model relationships. The ribbon at the top includes tabs for File, Home, and Help, with various tools for data acquisition, transformation, and relationship management.

The central workspace shows three tables in the data model:

- Dim_Admission**: Columns include Admission id, Admission Type, Doctor, Hospital, Medical Condition, Medication, Room Number, and Test Results.
- Billing**: Columns include Admission id, Billing Amount, Date of Admission, Discharge Date, Insurance Provider, and Patient id.
- Dim_patient**: Columns include Age, Age group, Blood type, Gender, Name, and Patient id.

Relationships are visualized as lines connecting the tables:

- A one-to-one relationship exists between **Dim_Admission** and **Billing** on the **Admission id** column.
- A one-to-one relationship exists between **Billing** and **Dim_patient** on the **Admission id** column.

The **Properties** pane on the right shows the details for the selected relationship:

- Relationship**: Dim_Admission (Table) to Admission id (Column).
- Cardinality**: One to one (1:1).
- Make this relationship active**: Yes (checked).
- Cross-filter direction**: Both.

The **Data** pane on the right shows the list of tables and their columns:

- Dim_Admission**: Admission id, Admission Type, Doctor, Hospital, Medical Condition, Medication, Room Number, Test Results.
- Dim_patient**: Age, Age group, Blood Type, Gender, Name, Patient id.
- healthcare_dataset**: Admission Type, Age, Age group, Billing Amount, Blood Type, Date of Admission, Discharge Date, Doctor, Gender.
